

**ABSTRACT OF THE DISCLOSURE**

A bird feeder support for supporting a solid bell-shaped bird feeder  
5 includes a base having an upper surface, a lower surface and a peripheral  
edge. Each of a pair of legs has a first and a second end. The first ends  
are each attached to the base such that each of the legs extends upwardly  
from the base. Each of the legs is arced such that the second ends abut  
each other and an inner perimeter edge of the legs is defined. A coupler  
10 is adapted for removably securing a bird feeder to the pair of legs such  
that the bird feeder is suspended between the legs.
